SECTION 01

Quick start

Five minutes from install to a working live dashboard.

FROM THE DMG ON YOUR DESK TO A WORKING DASHBOARD IN FIVE MINUTES.

1 · Quick start

Install ACE, watch the welcome screen, walk through the wizard, hit Start. ACE listens to the room and pushes the right slide automatically — without anyone clicking through cues during the keynote, the class, the show, or the service.

Install

1. Open the DMG you downloaded. Drag **ACE** into the **Applications** folder.
2. Eject the disk. Open ACE from your Applications folder (not from the DMG).
3. The first launch takes 10 to 30 seconds while ACE prepares the AI model.

The welcome moment

The first time you open ACE you'll see a brief animated welcome screen. Click anywhere to dismiss it, or wait 15 seconds and it'll move on by itself. If you prefer no motion at all, ACE honours your system's *Reduce motion* setting and shows a calm static version instead.

Five-step wizard

From there the wizard walks you through:

1. **Welcome** — what ACE does and how the rest of the wizard will play out.
2. **Backend ready** — ACE confirms its engine is up. If your Mac is new to ACE this can take half a minute.
3. **Speech model** — the AI model downloads in the background. The bar shows real progress: bytes, megabytes, estimated time.
4. **macOS permissions** — microphone and screen-recording access. Each step has an **Open Settings** button that jumps you straight to the right pane in System Settings.
5. **Done** — click **Start using ACE** and you're on the main dashboard.

Start the service

1. Click **Start** in the top-left of the toolbar. ACE begins listening.
2. Speak, sing, or read something the system knows. If you've imported a song library, the lyrics auto-push to PROGRAM.
3. To send to a real audience screen, open Screen Configuration with ⌘ + ⇧ + S.

> TIP You can re-trigger the in-app tour any time from **Settings → General → Show tour again**. You can re-run the whole setup wizard from **Settings → Audio → Recovery → Re-run setup wizard**.

SECTION 02

The dashboard

A map of every panel and what it does.

A MAP OF EVERY PANEL AND WHAT IT DOES.

2 · The dashboard

```

╚═══════════════════════════════════════════╩═══════════════════════════╝
```

Toolbar — left side

- **Start / Stop** — turns AI listening on and off.
- **Audio visualiser** — a traffic light for your microphone level. Amber and pulsing means too quiet; green means good; red means peaking. Click it to open Audio settings.
- **Auto / Song / Bible** — what ACE listens for. Auto picks the right kind contextually; Song-only locks to lyrics; Bible-only locks to scripture.
- **Live / Hold** — Live pushes detected matches to PROGRAM. Hold lets ACE keep listening without pushing anything (useful between songs).
- **Confidence ±** — lets you tune the AI threshold during the event.

Toolbar — center (workflow modes)

Tab	What it does
Show	Default live view. Detected lyrics and slides auto-push to PROGRAM.
Edit	Edit song lyrics and sections in a slide-grid (1 to 6 columns; click a card to expand, drag the handle to reorder spatially).
Bible	Browse and display scripture.
Theme	The canvas-based theme designer.

Tab	What it does
Looks	Bundle themes, per-screen overrides and layer toggles into named presets.
Stage	Design the operator's confidence-monitor layout.
Service Plan	Plan the order of items for the day: songs, scripture, prayer, sermon, announcements.

Toolbar — right side

- **Import** — opens the unified wizard for songs, Bibles, slides and audio.
- ⚙ **Settings** — opens the Settings page.
- **Audio visualiser** — see toolbar-left.

Sidebar (left)

Your library: songs, presentations, Bibles. Drag items to reorder; the order becomes the day's **Service Plan**.

Centre column

- **Show** — current and next song-section cards, live transcript, scripture display, and the slide grid for the selected presentation.
- **Edit** — the slide-grid section editor (1 to 6 columns, click a card to expand, drag to reorder).
- **Bible** — verse-context view.

Right panel

- **Preview / Program** — what's queued (Preview) and what's live (Program). This is where most operators drive the event from.
- **Macros** — buttons for common automations (clear all, switch look, blank).
- **Sermon Notes** — record talks or sermons with auto-detected scripture references.

Media Bin (bottom dock)

Playlists, the asset library, single-click trigger, fit modes, and the stock-content filter. Drag a media item onto the slide preview to make it the audience background.

SECTION 03

Bringing in your content

Songs, Bibles, slides, audio — through one wizard.

3 · Bringing in your content

⌘+I or click **Import** in the toolbar. One wizard for everything you bring into ACE — songs, Bibles, slides, audio.

Six-stage wizard

Stage	What happens
Source	Drag-and-drop or pick files. ACE detects what each one is automatically.
Preview	See each item before it goes in. Bible references inside PowerPoint titles and speaker notes are tagged per slide automatically.
Resolve	If something already exists in your library, pick Skip, Replace or Continue for each item.
Template	Apply a default theme to imported items.
Import	Ingestion runs. PowerPoint slide images continue rendering in the background after you close the wizard.
Summary	Counts and per-item status, plus a reference list for Bible-detected items.

What you can import

Type	Formats
Songs	Plain text · ChordPro `.cho` · OpenLyrics XML · OpenSong XML · ProPresenter `.pro6` / `.pro7` / `.pro` · OpenLP `.osz`
Bibles	MyBible `.SQLite3` · OSIS XML · Zefania XML · OpenSong XML
Slides	PowerPoint `.pptx` · Keynote `.key` · PDF · numbered image-sequences (PNG / JPEG / WebP / HEIC) or a folder of them
Audio	`.mp3` · `.wav` · `.m4a` · `.aac` · `.ogg` · `.flac` · `.aiff`

If your Mac doesn't have LibreOffice yet

ACE uses LibreOffice in the background to turn PowerPoint files into slide images. The first time you import a PowerPoint deck on a Mac without LibreOffice installed, ACE downloads and installs it for you (about 280 MB). Approve once and every future PowerPoint import uses the same install.

> V1.6 — NEW ProPresenter Migrator. If you're moving from ProPresenter 6 or 7, see Section 4. One click and your whole library comes across — with previews, a tagged import session, and a one-click undo if anything looks off.

SECTION 04

ProPresenter Migrator

A one-click on-ramp from ProPresenter 6 or 7.

4 · ProPresenter Migrator

A one-click on-ramp for teams moving from ProPresenter 6 or 7 to ACE. Auto-detects your install, scans the library, previews what will be imported, runs it, and tags the whole session so you can undo it later with a single click.

Where to find it

- If ACE detects a ProPresenter install on first launch, the onboarding wizard offers the migrator automatically.
- Any time after that, **Settings → Import → ProPresenter Migrator**.

What it imports

- **Songs** — read from both `.pro7` and the newer `.pro` filenames. Lyrics are cleaned from ProPresenter's internal formatting; duplicate slides that are really the same lyric in disguise are removed automatically.
- **Media** — backgrounds, images, video clips. ACE de-duplicates by file content (two copies of the same image come across once).

The flow

1. **Detect.** ACE finds your ProPresenter install — both the default location and any custom library paths you've configured inside ProPresenter.
2. **Scan.** The migrator counts what's there: number of songs, number of media files, total size.
3. **Preview.** Look at exactly what will come across before anything happens.
4. **Choose how to handle media.**
   - **Symlink** (default) — ACE links to your existing files. Fastest. Doesn't duplicate disk usage. Your ProPresenter library stays the source of truth on disk.
   - **Copy** — ACE copies every file into its own folder. Use this if you plan to delete ProPresenter later, or if your ProPresenter library is on an external drive you might unplug.
5. **Import.** Everything comes across, tagged with the date and time of this session so it can be undone later.
6. **Undo, any time.** Open the migrator again, find the session in the history list, click Undo. Songs and media from that session are removed; anything else in your ACE library is untouched.

> TIP Run the migrator once with **Symlink**, do a full service or rehearsal in ACE, then come back and switch to **Copy** if you want to retire ProPresenter entirely. Sessions are independent — you can have several in your history.

SECTION 05

Themes and Looks

Separate how things look from what's enabled.

5 · Themes and Looks

ACE separates *how things look* (Theme — fonts, colours, background) from *what's enabled* (Look — which layers render on which screens).

Themes

A theme defines: font family, size, weight and colour; subtitle colour; background mode (solid, gradient, or image); text shadow; position; margins; line-reveal speed.

- Click **Theme** in the toolbar.
- The grid shows your themes. Click a tile to open the editor. Hover the play button to apply a theme to PROGRAM without editing. Hover ✕ to delete.
- **+ New Theme** creates a custom one from a template.

Looks

A Look is a named bundle of:

- Which layers render: *slide, media, messages, announcements, bible, props*.
- Which theme each output uses (different theme per screen if you want).
- Per-screen layer overrides (one screen shows media, another doesn't).
- Transition duration.

Click **Looks** in the toolbar. The per-Look grid lets you toggle layers per output and pick the theme each output should use. Click **Make Live** to activate a Look — PROGRAM repaints within about a second.

Unified render pipeline

Settings → Screens & Display → Advanced → Unified render pipeline.

- **On** — the active Look drives every output. Edit a Look and audience screens repaint in real time. Per-screen overrides apply.
- **Off** — the older behaviour where one global theme drives all outputs. Looks save but don't take effect.

Once you've used the Unified render pipeline for one full event, leave it on. A future release flips this default.

SECTION 06

Outputs

One source of truth for every audience and stage screen.

6 · Outputs (Screen Configuration)

⌘ + ⇧ + S opens Screen Configuration — the single source of truth for what your audience and your operator team see.

Audience vs Stage

- **Audience** — what the room sees. Lyrics, backgrounds, scripture. Edge-to-edge.
- **Stage** — what the worship team, lecturer, preacher, or actors see. Confidence layout (current and next slide, timer, clock, sermon notes). Designed for the person on stage.

Multi-display

Both roles can drive multiple displays — for example seven audience screens plus three stage screens at once if your rig has the displays. Each role's toggle drives all assigned displays in lockstep.

Display Mode (per output)

- **Borderless Fill** *(default)* — fills the display without taking over your operator's Mission Control. Multi-display friendly. Used by most rigs.
- **True Fullscreen** — own Mission Control Space, smoother for single-output venues. Swipe with a four-finger trackpad to reach the operator UI.

State badges

Badge	Meaning
Unassigned	Placeholder — no display picked.
Assigned	Output picked but the role toggle is off; the window isn't open.
Live	Role toggle on; the window is painting on the assigned display.
Identifying	Temporary — visible while you click Identify.
Test Pattern	Temporary — visible while Color Bars / Focus / Greyscale / Solid is running.

Screens menu (macOS menu bar)

- **Configure Screens** ⌘ + ⇧ + S.
- **Identify All Displays** — flashes `DISPLAY N` on every connected display.
- **Test Pattern** — Color Bars, Focus, Greyscale, Solid.
- **Clear All Overlays** Esc.

> TIP · V1.5.7 On a single-display Mac, ACE keeps your dock and menu bar visible while the audience window is up so you can still get back to the operator UI. On a multi-display rig the audience output sits on top of its own display, so your dock is never covered there anyway.

SECTION 07

Detection

On-device AI. About 200 milliseconds, room to screen.

7 · Detection — lyrics and Bible

ACE listens to your room with on-device AI and matches what it hears against your library — songs and scripture both. About 200 milliseconds from sound in the room to slide on the screen.

Modes

- **Auto** — detects either lyrics or Bible references and switches contextually.
- **Song** — locks to lyric matching. Best during worship sets and song-led events.
- **Bible** — locks to scripture references. Best during sermons, lectures and any talk that quotes scripture often.

Switching modes automatically clears any stale detection state. You don't need to stop and restart.

Sermon recording

Bottom-right of the dashboard there's a **Sermon Notes** panel.

1. Optional — fill in title and speaker.
2. **Start Recording** — ACE captures the full transcript, extracts key points, and auto-detects Bible references as the talk unfolds.
3. **Stop Recording** — the Export button appears. Export contains full transcript, key points and scripture, with the live snippet that triggered each scripture match shown beneath the canonical verse.
4. Past recordings live under **Settings → Data → Sermon History**.

Smart Bible auto-advance

When a verse is on screen, ACE listens for the next verse's text in the live transcript. If the speaker reads verse N+1 directly without saying "next verse," ACE advances on its own. The slide tracks the speaker — nobody clicks.

Verse lock

⌘+⇧+L toggles a lock on the currently-displayed Bible verse. While locked, ACE keeps listening and shows possible matches in the transcript feed, but nothing auto-pushes to the audience screen. You can still advance or retreat manually with `PageUp` / `PageDown`. Press ⌘+⇧+L again to unlock.

> V1.5.5 — NEW Verse lock solves the "ACE found the right verse but keeps suggesting alternatives" situation. Once a preacher is sitting on a verse and unpacking it, lock the verse and let ACE go quiet without losing the live transcript.

Detection Reset

⌘+⇧+R clears stuck votes, transcript history, and the AI's listening context — without stopping the microphone. The right move if a detection has drifted onto the wrong song or verse and won't recover.

SECTION 08

Stage layouts

Confidence monitors built object-by-object.

8 · Stage layouts

The operator's confidence monitor is fully designable. Open the **Stage** tab in the toolbar.

Pick a preset (`current-next`, `current-notes`, `current-timers`, `system-clock`, `blank`) or create a new layout.

Object types

- **Text** — static labels.
- **Live text** — a piece of text that updates: current slide, next slide, system clock, timer, presentation name, stage message, video countdown.
- **Shape, image, media placeholder**.

Each object has a position and size on a 1920×1080 canvas. Style picker lets you choose a semantic colour token (primary, secondary, next, timer, clock, muted) so the colour follows the active theme, or set a custom hex.

Mirror Program

Each stage layout has a **Mirror Program** checkbox. When on, the stage screen mirrors whatever's on the audience output (slide image, scripture, song background, video) as a full-bleed backdrop — with your text objects (current/next lyric, clock, timer, stage message) on top. Speakers, lecturers, preachers and actors see exactly what the audience sees, plus their cues, without turning around.

SECTION 09

Service Plan & Quick Screens

Plan the run of show. Push ad-hoc screens in one click.

9 · Service Plan & Quick Screens

The day's order, in one place; and a fast way to push ad-hoc screens between items.

Service Plan

Drag songs, scripture, prayer, sermon, announcements and media into a vertical timeline. Press **Go On Air** to advance through the items.

- The first time you click **Add Item**, ACE creates a plan called "Untitled Service" with today's date. You can rename it and re-date it any time.
- Each item has its own theme, layer configuration, timer, and auto-advance rules.
- Planning Center Online sync is available if your church already uses Planning Center.

Quick Screens · ⌘ + J

A floating panel at the bottom-right of the dashboard. Type a message, pick a theme, push to PROGRAM in one click.

- ⌘ + J toggles open or closed (skipped while you're typing inside an input or textarea, so "j" still types).
- ⌘ + ↵ displays the typed message.
- Your last 10 entries live on a **Recent** shelf for one-click reuse.
- Use cases — announcements, prayer calls, offering reminders, lower-thirds between scenes.

SECTION 10

Settings

Every preference, grouped.

10 · Settings

⌘+, or click ⚙ in the toolbar. The sidebar groups every setting under a high-level category.

General

- **App** — app name, theme (light or dark — currently dark), language.
- **Updates** — current version, latest release, and the notes that came with it.
- **Audio** — input device, sample rate, gain, plus **Recovery** (re-download the speech model, re-run the setup wizard).
- **Network** — backend port and allowed origins.
- **CCLI** — your church CCLI licence number. ACE shows it on slide footers and includes it in exports.
- **Display Hold** — how long strong-confidence matches stay on screen, and how long weak matches stay.
- **Tour** — re-trigger the in-app tour.

Detection

- Detection mode — Auto, Song-only, Bible-only.
- Confidence threshold — global AI confidence floor.
- Bible parser — strict or lenient matching; how many verses of context to show.
- Voice control — voice commands like "ACE next slide".
- Speech model — pick the size that balances accuracy and memory for your Mac.
- Transcription language — Auto-detect (handles code-switching between languages), or pick a specific one.
- Online transcription — Deepgram on / off.
- Auto-display Bible — whether Bible detection auto-pushes to PROGRAM.

Output

- **Screens & Display** — Configure Screens, per-output assignment, role, display mode.
- Theme background and typography.
- Unified render pipeline — see Section 5.
- NDI output — toggle, source name, channel.
- MIDI — incoming MIDI shortcut bindings.

Data

- Song Index — re-index, drop & rebuild, view index size.
- Import — default conflict-resolution mode and default theme.
- PowerPoint rendering — DPI and rendering backend.
- LibreOffice — install, re-install, view status.

Bibles

The Bibles screen lists every Bible translation ACE knows about — the five it ships with (KJV, ASV, BBE, WEB, RV1960), plus anything you've imported yourself. Imported translations appear in a **Custom** group at the bottom. The same translations show up in the Bible panel's dropdown.

> `TIP · V1.6.1` If you previously imported a Bible that didn't show up in the translation dropdown, just open ACE on v1.6.1 — your imports are now visible everywhere.

SECTION 11

Shortcuts

The complete keyboard reference.

11 · Keyboard shortcuts

Every shortcut in ACE, grouped by what it does. Per-shortcut customisation is on the roadmap; today every shortcut listed here works as shown.

Clear layers

F1	Clear all layers
F2	Clear slide / text
F3	Clear media (background)
F4	Clear props (foreground overlay)
F5	Clear audio
F6	Logo / black toggle
Esc	Clear display (everything)

Slide playback

Space	Take selected slide to PROGRAM (live)
P	Send selected slide to PREVIEW
G	Go Live (alternate)
→	Next slide
←	Previous slide
Home	First slide
End	Last slide
Tab	Next slide (alternate)
⇧ Tab	Previous slide (alternate)
PageDown	Next Bible verse
PageUp	Previous Bible verse

Screen outputs

⌘ 1	Toggle audience output
⌘ 2	Toggle stage output
⌘ ⇧ S	Open Screen Configuration

Navigation

⌘ K	Command Palette — fuzzy search / action launcher
⌘ L	Library (sidebar)
^ B	Bible mode
⌘ ,	Settings
⌘ F	Manual lyric search
⌘ I	Import wizard
⌘ J	Toggle Quick Screens

Toolbar modes

⌘ E	Edit mode
⌘ T	Text format mode
⌘ ⇧ M	Media browser

Detection

⌘ ⇧ D	Toggle detection — start / stop	
⌘ ⇧ R	Reset Detection — clear stuck votes, hallucinations, transcript history	
⌘ ⇧ L	Lock / unlock the current Bible verse	v1.5.5

macOS menu (always works)

⌘ ,	Preferences (Settings)
⌘ D	Start detection (from Detection menu)
⌘ ⇧ D	Stop detection
⌘ Q	Quit ACE
⌘ W	Close window
⌘ M	Minimise
⌘ H	Hide ACE

Quick Screens (when panel is open)

⌘ ↵	Display the typed message
Esc	Close the panel

SECTION 12

Workflows

How a Sunday morning, a keynote, a class, a show, a migration each run.

12 · Common workflows

Sunday-morning worship service

1. Open ACE 30 minutes before service.
2. **Service Plan** tab — drag today's songs in order (or sync from Planning Center).
3. ⌘+⇧+S — confirm Audience and Stage toggles are on, displays assigned, both Live.
4. Pick the **Look** that matches the service mood (e.g. "Standard", "Worship", "Scripture").
5. **Start** detection. Walk to the booth, hand over to the operator.
6. During worship — ACE auto-advances through detected songs. Press F1 between songs to clear, or just let the Display Hold expire.
7. Sermon — switch to **Bible** mode (^+B) or stay on Auto. **Sermon Notes** start recording; scripture detected and pushed automatically. If the preacher settles on one verse, lock it with ⌘+⇧+L.
8. After service — stop detection, export the sermon for archiving.

Conference keynote / mid-week event

1. **Import** the speaker's deck (PowerPoint, Keynote, or PDF) via the wizard.
2. Bible references in slide titles and notes are auto-tagged.
3. During the talk — slides advance automatically as the speaker progresses. → for manual override.

Classroom lecture

1. Import the lecture deck (PowerPoint / Keynote / PDF / image-sequence).
2. Use Auto detection — citations, scripture references and section heads auto-push as the lecturer hits them.
3. Open **Quick Screens** (⌘+J) for ad-hoc announcements ("five-minute break", "hand in worksheets").

Theater & live show

1. Pre-load the cue order in **Service Plan**.
2. Use **Quick Screens** for ad-hoc announcements between scenes.
3. Lower-third overlays go through the **props** layer in the Media Bin.

Migrating from ProPresenter

1. Install ACE. On first launch the wizard offers the migrator if it spots a ProPresenter install. Accept.
2. Preview what's coming across. The counts should look right.
3. Pick **Symlink** for the first import. Your ProPresenter library stays where it is on disk.
4. Run the import. Walk through your library inside ACE — songs, media — and confirm everything's there.
5. Run a rehearsal in ACE. If anything's missing or wrong, open the migrator again and click **Undo** on the session.
6. When you're ready to retire ProPresenter entirely, run the migrator a second time with **Copy** selected so your files live inside ACE.

SECTION 13

Troubleshooting

When something is wrong — start here.

13 · Troubleshooting

"My microphone level is low" (visualiser is amber)

- Check the input device in **Settings → General → Audio**.
- If you're using an external interface, confirm the worship-room / stage mic is routed to ACE's input.
- Move closer to the mic source if you can.

"Detection isn't picking up my song"

- Confirm it's in your library — **Settings → Data → Song Index**.
- Try Manual Search (⌘+F) — this confirms ACE has indexed the lyrics.
- If the song is genuinely obscure, ACE can fall back to audio fingerprinting on the cloud-fallback path.

"My slide isn't reaching the audience screen"

- Confirm Audience output is **Live** (green badge in ⌘+⇧+S).
- If the active Look has the *media* layer disabled per-screen, slides hide. Open the Looks panel to check.

"My stage output shows the wrong layout"

- Open the **Stage** tab and confirm the right preset is active.
- If you have a Look applied with a stage override, check that.

"Detection is hallucinating or pushing the wrong verse"

- Press ⌘+⇧+R. This clears stuck votes, the transcript history, and the AI's listening context without stopping your microphone.
- If it keeps happening on a specific verse, lock the verse with ⌘+⇧+L and advance manually.

"PowerPoint imports as plain text on black, no slide design"

- This is a LibreOffice background-conversion issue. ACE re-runs the conversion in a fresh workspace every time, which fixes the most common cause. If it still happens, contact support — ACE captures the failure detail in the log so we can help quickly.

"I cleared a slide but the image is still on the audience screen"

- Fixed in v1.5.4 and later. `F2` now clears the lyric overlay *and* the slide image as one cue. Make sure you're on v1.5.4 or newer.

"After I plug into a single external display, my dock disappears"

- Fixed in v1.5.7 and later. On single-display setups, ACE keeps your dock visible.

"I imported a Bible but I can't see it in the dropdown"

- Fixed in v1.6.1. Update to the latest version and your imported translations will appear in the Bible panel's translation list and in **Settings → Bibles**.

"ACE won't launch on my Intel Mac"

- Fixed in v1.6.0. Earlier versions had an issue specifically with Intel Macs. Download the latest version from **ace-presenter.app** and reinstall.

"My ProPresenter migration imported the wrong items"

- Open the ProPresenter Migrator again (**Settings → Import**). Find the session in the history. Click **Undo**. Run the migrator again from scratch.

SECTION 14

Reference

Your data, the glossary, every panel.

14 · Your data

ACE keeps everything on your Mac. Nothing important is in the cloud unless you explicitly turn on a cloud feature.

Where it lives

- Your imported songs, Bibles and presentations live in an ACE data folder inside your Mac's user library.
- Your operator preferences live in a single configuration file in that same folder.
- Backend and main logs live in a separate Logs folder in your user library.
- LibreOffice, when installed via ACE's deferred-install, lives inside the same ACE data folder.

Resetting ACE

To reset ACE completely:

1. Quit ACE.
2. Open **Settings → Audio → Recovery → Re-run setup wizard** next time you start ACE — this clears the wizard flags but keeps your library, themes and Looks.
3. Or, for a full factory reset, delete the ACE data folder in your user library and relaunch. The first-run wizard fires again from scratch.

> WARNING A full reset deletes your imported library, your themes, your Looks, your stage layouts and your service plans. Use Recovery → Re-run setup wizard if you just want to redo onboarding.

15 · Getting help

- **In-app tour** — **Settings → General → Show tour again**.
- **Release notes** — **Settings → General → Updates** shows what changed in your version.
- **Email support** — **hello@ace-presenter.app**.
- **Marketing site** — **ace-presenter.app**.

16 · Glossary

Look — a named bundle of theme + layer toggles + per-screen overrides + transition.

Theme — typography + colours + background style (gradient / solid / image).

Layer — one of: slide (lyrics), media (background), messages (audience-bottom strip), announcements (banner), props (foreground overlay), bible (scripture).

Screen vs Output — Screen is what ACE renders; Output is where it goes (HDMI / NDI / SDI).

PROGRAM — what's currently live on the audience output.

PREVIEW — what's queued to go live next.

Service Plan — the day's order of items.

Make Live — the action that activates a Look. PROGRAM repaints within about a second.

Borderless Fill vs True Fullscreen — Borderless fills the display without taking a Mission Control Space; True Fullscreen gets its own Space.

CCLI — Christian Copyright Licensing International. Most churches need a current Church Copyright Licence to project copyrighted hymns / songs / lyrics.

ProPresenter Migrator — the v1.6 feature that brings songs and media across from ProPresenter 6 or 7 with a tagged, undoable session.

Verse lock — a v1.5.5 detection mode that pins the currently-displayed Bible verse so it doesn't get auto-replaced while the speaker is unpacking it.

Mirror Program — a stage-layout toggle that mirrors the audience output behind your stage cues.

17 · Feature index

Every distinct surface in the app. Use it as a discovery aid — the workflow narrative is in earlier sections.

Toolbar (top of dashboard)

Control	Function
Start / Stop	Toggles detection. Audio capture and AI matching, all on.
Audio visualiser	Mic-level traffic light. Click to open Audio settings.
Auto / Song / Bible	Detection mode. Switching auto-clears stale state.

Control	Function
Live / Hold	Live pushes detected matches to PROGRAM. Hold runs detection without pushing.
Confidence ±	Live-tweak the AI threshold.
Show / Edit / Bible / Theme / Looks / Stage / Service Plan	Workflow mode tabs (centre).
Import ⌘ + I	Unified wizard for songs / Bibles / slides / audio.
⚙ **Settings** ⌘ + ,	Open settings.

Sidebar (left)

- Library tabs — Songs / Presentations / Bibles.
- Sub-filters — recently used, by source, by language.
- Drag-reorder — sets the current Service Plan order.
- Add via **+** — opens the song-add modal (lookup, paste lyrics, search).
- Drag-and-drop — accepts files, routes through the Import wizard.

Centre column

Mode	Surface
Show	Current and Next song-section cards, live transcript, scripture display, slide grid for selected presentation.
Edit	Slide-grid section editor — 1 to 6 columns, click to expand, Esc to collapse, drag to reorder spatially.
Bible	Verse browser, context view, auto-display.
Theme	Grid of saved themes; click a tile to open the editor.
Looks	Per-Look grid of layer toggles, per-screen theme overrides, transition duration.
Stage	Stage layout editor — canvas (1920×1080), object placement, Mirror Program toggle.
Service Plan	Vertical timeline, drag-reorder, Go-On-Air. Auto-creates "Untitled Service" on first item.

Right panel

- **Preview / Program** — what's queued (Preview) and what's live (Program).
- **Macros** — operator-fired automation buttons.
- **Sermon Notes** — title, speaker, Start / Stop Recording. Auto-detects scripture during talks.

Media Bin (bottom dock)

- Playlists — saved sets of media.
- Asset library — every imported video and image, filterable.
- Stock filter — search third-party stock libraries.
- Per-asset fit mode — fit / fill / stretch.
- Drag onto preview — sets as the audience background.

Output windows

- **Audience window** — renders PROGRAM theme + slide / scripture / lyrics overlays.
- **Stage window** — renders the active stage layout's objects. Mirror Program shows a full-bleed audience backdrop with stage cues on top.
- **Multi-view** — live preview of every output in one window. Read-only.

Floating surfaces

- **Quick Screens** (⌘ + J).
- **Command Palette** (⌘ + K) — fuzzy-search action launcher.
- **In-app tour** — re-trigger from **Settings → General → Show tour again**.
- **Onboarding wizard** — Welcome → Backend → Model → Permissions → Done. Re-run from **Settings → Audio → Recovery**.
- **Animated welcome splash** — first-launch brand intro. Click anywhere to dismiss. Honours your system's Reduce-motion setting.

Migrator

- **ProPresenter Migrator** — one-click import from ProPresenter 6 / 7. Auto-detect, preview, symlink-or-copy, undo by session.
